Product Attribute Reports
Posted by jkpcguru - 11 Jan 2011 02:05

_____

Hi

I'm thinking about buying your extension for my online store.

Would I be able to do the following:

Run a report giving me an order count of each size for each tshirt I sell so I know how many to order of each size in bulk

Example:

Tshirt 1

# of Small

# of Medium

# of Large

Tshirt 2

# of Small

# of Medium

# of Large

Thanks

John

Hi John,

Thank you for your interest in our products.

The point you mention can be very useful, but it has some complexity. VM stores order items information in one register in the database, and that register holds the item (product) attributes in one unique text field. That means that when you're dealing with one or more attributes, you get a property like text, for example:

size=medium
color=red

This text-based information is hard to parse and process on SQL queries, but even though, I believe we can do something about it (grouping information by this field content, we'd only need to parse it once after the query).

Let us take a deeper loop at it, and if it's doable, we'll include a new report area called **Product Attributes**   with all the information reports, ok?

Thank you for your feedback.

Kind regards.
